Responses Regarding Poor Prenatal Diagnosis

Abortions of children diagnosed with abnormalities in the womb are eugenic

- Abortion is used to discriminate against children with abnormalities, applying eugenics.
- Discrimination against babies diagnosed in utero with Down syndrome is well documented:
  - France: documented 96% abortion rate for those diagnosed in the womb with Down syndrome.  
  - U.K.: abortion rate for unborn Down syndrome children reported as high as 92% to 100%.  
  - U.S. data: a 2012 study found a weighted mean from 61% up to 93% of those diagnosed in the womb with Down syndrome were aborted.
  - A new report, using rigorous statistical modeling of the sparse U.S. data from 2006-2010, finds that abortion after prenatal diagnosis has reduced the population of individuals living with Down syndrome in the U.S. by approximately 30%.

- Similar rates of selection against life are seen for babies diagnosed in the womb with other genetic conditions, or with physical abnormalities. This is modern eugenic selection.

The term “incompatible with life” is a judgment, not a medical diagnosis

- Doctors often use the term “incompatible with life” to describe children diagnosed in the womb with a lethal or potentially lethal condition. The term is a value judgment on a child’s life. It is “medically meaningless, incorrect, and enormously hurtful.” It conveys an attitude, not reality.
- A study in Critical Care Medicine noted that what doctors tell parents about their child’s prognosis is often influenced by the doctor’s own attitude toward neurological impairment.
- Skotko et al. found 99% of people with Down syndrome are happy with their lives, 99% of parents said they love their child with Down syndrome, and 97% of brothers/sisters, ages 9-11, said they love their sibling.
- Disability rights groups in an amicus curiae brief filed in 2013 with the Supreme Court state: “Though some abortions of children with disabilities involve diagnoses that are likely to be fatal, many involve non-fatal conditions such as Down syndrome, cystic fibrosis, and spina bifida.”
- Even in these non-fatal cases, “recent evidence suggests that as many as 95 percent of parents receiving a prenatal diagnosis of cystic fibrosis elect to terminate the child.” The Supreme Court “has never endorsed a right to abort children only because they have been detected to have a disability.”

There are hopeful alternatives to abortion for young preborn patients

- A study in Pediatrics regarding children with trisomies notes: “Despite the conventional understanding of these syndromes as lethal, a substantial number of children are living longer than 1 year and undergoing medical and surgical procedures as part of their treatment.”
- Bradford lists several clinical trials, all begun within the last six years, with drugs that show promise to improve cognition for individuals affected by Down syndrome.
- Fetal surgery is undergoing a rapid expansion as more doctors and parents realize the possibility, and even advantage, of surgery while the child is still within the womb.
- Some conditions, including genetic abnormalities such as severe immune deficiencies and osteogenesis imperfecta, are now treated in the womb using adult stem cells or gene therapy.
**Perinatal hospice is the proper response to lethal anomalies. Even a brief life has meaning.**

- Abortion does not resolve cases where a lethal fetal anomaly exists; abortion destroys one of the patients -- the youngest. Patients and their families can and should be offered the option of perinatal hospice to support them in the same way we do families with an adult member for whom treatment has become futile.  
- There are at least 230 perinatal hospice programs in the United States.  

**Late term abortions are NOT primarily due to discovery of fetal abnormalities or health of the expectant mother**

- Dr. Priscilla Coleman in 2010 (citing the Guttmacher Institute): “[T]he vast majority of late-term abortions are performed for socio-economic reasons, on a healthy and potentially viable fetus.” “Fetal abnormalities or woman’s health considerations are rarely the reason for undergoing a late-term abortion.”  
- Dr. Elizabeth Johnson in 2015: Women seek abortion because of the stress of “unprepared pregnancy, single-motherhood, financial pressure and relationship discord.” Moreover, these stresses “are not fundamentally alleviated or ameliorated by late-term abortion. Late-term abortion places these women at greater risk of surgical complications, subsequent preterm birth, and mental health problems, while simultaneously ending the life of an unborn child.”
